                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), Iver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the antigenic epitope P593, derived from circumsporozoite protein (CSP) of the sporozoite stage of plasmon falciparum. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vacous construction of the construction of recombinant protein construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum, CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 2; Page 16; 52pp; English.

The DNA encoding the 1st 81 AAS of the N-terminal of NS1 (NS1_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region less the first nine N-terminal AS. This CS fusion is designated RLfdelta9. The Pro residue separating the Asp (at the C-terminal Site. The peptide can be used in a vaccine for protection against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural C protein 1 (NSI), [Beze et al., Nucleic Acids Research, 8: 5845] (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region C [C (NSI_81)] is linked via a synthetic sequence to DNA encoding Region C [C (NSI_81)] is linked via a synthetic sequence to DNA encoding Region C [C (NSI_81)] is linked via a synthetic sequence to DNA encoding Region C [C (NSI_81)] is linked via a synthetic sequence to DNA encoding Region C [C (NSI_81)] is linked via a synthetic sequence to DNA encoding Region II conts is fused to DNA encoding Region II-conts [I seed to Separating Region I and Region II-conts [I seed to BamHI site; the Gly separating Region I and Region II-conts [I seed to Separating Region I and Region II linker. The peptide can be used in a vaccine for protection against malaria.

The complete nucleotide and AA sequences are given in EP-304720, See also AAR12306-R12311 and AAR13175-R13179.

                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural C protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NS1 (NS1_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is 10 clinked to a synthetic sequence encoding two repeat units from the C linked to a synthetic sequence encoding two repeat units from the Region II-contg. CS app (at the C-terminal of the linker) from the Region II-contg. CS flanking region is an artifact of a filled-in BamHI site; the Gly region is an artifact of a synthetic FoklyTthIII I linker. The peptide can be used in a vaccine for protection against malaria.

                                                                                                                                                                                                            The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1,81) is linked to a synthetic sequence encoding four repeat units from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I conty. Flanking a synthetic sequence to DNA encoding Region I conty. Flanking region less the 18 AA signal region. This is linked to DNA encoding Region II-conty. Flanking region. The pro residue separating the As (at the C-terminal of the linker) from the Region I-conty. CS flanking region is an artifact of a filled in Bamili site; the GJy separating the Region I and II-conty. CS flanking regions is an artifact of a synthetic FOKI/ThIII I linker. The peptide can be used in a vaccine for protection against malaria.

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: $93 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: $845 (1980)]. The DNA encoding the 1st #81 AAs of the N-terminal of NSI (NSI_81) is linked to a synthetic sequence encoding four repeat units (the variant form) from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is contg. flanking region less the 18 AA signal region. This is residue separating the Asp (at the C-terminal of the linker) from the Region I-contg. CS flanking region is an aftifact of a filleding hashing regions is an artifact of a synthetic Fokl/TthIII inker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; T-celcumsporzoite protein (25P; sporzoite surface protein-1; SSP-2; circumsporzoite protein-1; MSP-1; merozoite surface protein-1; MSP-1; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; liver stage antigen-1; LSA-1; merozoite binding antigen-175; mapical membrane antigen-1, AMA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

                                                 sequence of the CS gene (AAN81108) is from lambda-mpfl. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused, in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) pre-S2-S protein coding sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, Pre-S1 coding sequence of Pre-S1-pre-S2 coding sequence, the CS protein coding sequence of Plasmodium, or a HIV coding sequence such as an HIV envelope gene sequence, e.g. HIV C7 protein coding region, HIV peptide 121 coding region, or HIV Dreesman peptide coding region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAP83144 standard;

                                                                                                      The present sequence is the antigenic epitope P593, derived from circumsporozotic protein (CSP) of the sporozotic stage of plasmodium circumsporozotic protein (CSP) of the sporozotic stage of plasmodium confunction. It is used in the construction of recombinant protein confunction of recombinant protein comprises, melitin signal peptide, (His)6 tag, The recombinant protein (CSP), sporozotic surface protein-2 (SSP-2), circumsporozotic protein (CSP), sporozotic surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozotic surface protein-1 (MSP-1), MSP-2, abtal membrane antigen-1 (AAM-1), erythrocyte binding antigen-175 (RBA-175), rhopty associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T cell helper site; cytotoxic T cell response; neutralising antibody; P.falciparum CS antigen; circumsporozoite; malaria; vaccine.
         Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle \,

                                         The peptide AAR66442 was synthesised to make a peptide vaccine which is recognised by a broad range of MHC types that will elicit a T helper cell response, a CTL response and a high titre neutralising antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide comprising immunogenic determinants from P falciparum for vaccine against malaria infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /label= AAs 297-412 of CS protein

```
The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., CScience 225: 593 (1984)], and the influenza virus non-structural protein [NSI], [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (NSI 81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region. C This CS fusion is designated RLfAuth. The Pro residue separating the ASP (at the C-terminal of the linker) from RLfAuth is an artifact of a filled in BamHi site, the Gly separating Region I and C FokI/TthIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic determinant; circumsporozoite; CS; vaccine; malaria; hybrid; influenza virus; non-structural protein 1; fusion.

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., the P. falciparum circumsporozoite (CS) protein [Dame et al., science 225 : 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8 : 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is linked to a synthetic sequence encoding two repeat units from the immunodominant region, which in turn is fused to DNA encoding to Region II-contg. flanking region. The Pror residue separating the Region II-contg. CS flanking region is an artifact of a filled-in BamHI site; the Gly separating the repeat units and the Region II-contg. CS flanking region is an artifact of a synthetic Fokl/TthIII I linker. The region is an artifact of a synthetic Fokl/TthIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Gaps
         The product is useful in preparation of vaccines for treatment and prophylaxis of plasmodium sporozite infection. It may be easily produced in large pure quantities from a transformed E.coli
                                                                                                                                                                                                                                                                                                               Immunogenic determinant; circumsporozoite; CS; vaccine; malaria; hybrid; influenza virus; non-structural protein 1; fusion.

Peptide antigens be synthesised in pure form and used to generate an immune response in vaccination against malaria. The featured repeat units are claimed and must be present in copies of 2-1000.

                                          the RTS expression cassette. This hybrid protein which is encoded by the RTS expression cassette. This hybrid consisits of a methionine residue derived from S. cerevisiae TDH3 gene sequence, three amino acids, Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the circumsporozoite protien (CSP) of plasmodium falciparum strain 768, an amino acid Arg created by the cloning procedure, four amino acids, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, preS2 protein, and a stretch of 226 amino acids specifying the S protein of HBV, adw serotype. This protein, and RTS* (see also AAR37797), may be combined with an adjuvant and used in a vaccine for preventing plasmodium infections.

                                                                                                  transcription termination region. A suitable coding sequence comprises the 1215bp Stul-Rsal fragment of WR201 conto. the P. falciparum CS protein coding sequence, minus its first 50bp. Also claimed is a transformed host cell, a method of culturing the cell to produce CS, the protein, and a vaccine. The vector comprises a 192 bp Sau3A fragment coding for 16 tetrapeptide repeats of the P. falciparum CS protein derived from Sau3A digestion of a 1215 bp Stul-Rsal fragment of WR201 containing the P. falciparum CS protein coding sequence minus approx. Its first 50 bp, or two, three, four or more tandem copies of
                                                                                                                                                                                                                                    Plasmid WR201 was obtained from the Walter Reed Army Institute of Research, and results from insertion of a 2.3 kb EcoRI fragment from lambda mpfl encoding the complete CS protein gene P. falciparum into vector pUC8. A recombinant DNA vector is claimed, which comprises a DNA sequence contg. the coding sequence of the CS P. falciparum operatively linked to an expression control sequence. Prefd. expression control sequences include the yeast glyceraldehyde-3p-dehydrogenase gene (TDH3) promoter and the yeast ornithine carbamoyl transferase gene (ARG3)
                                                                                       containing the P. approx. its first such 192 bp Sau3A

This sequence represents the RTS* hybrid protein which is encoded by the RTS* expression cassette. This hybrid consisits of a methionine residue derived from S. cerevisiae TDH3 gene sequence, three amino acids, Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the circumsporozoite protien (CSP) of Plasmodium falciparum strain NF54, an amino acid Arg created by the cloning procedure, four amino acids, pro-Val-Thr-Asn, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, pre52 protein, and a stretch of 256 amino acids specifying the S protein of HBV, adw serotype This protein, and RTS (see also AAR37796), may be combined with an adjuvant and used in a vaccine for preventing, plasmodium infections.
